15. SCOPE OF WORK

15.1 Scope and Intent for New Mexico Institute of Mining and Technology (NMT). The New Mexico Bureau of Geology and Mineral Resources, in collaboration with the New Mexico Interstate Stream Commission (NMISC), is conducting a study on changing surface water flow regimes between the San Acacia Diversion Dam and the upper reaches of Elephant Butte Reservoir. In order to evaluate the hydrologic response to these changes we are seeking a vendor to provide pressure transducers at appropriate ranges in 38 established monitoring wells, to provide real-time telemetry, or near real-time data, of groundwater level changes for each site listed in the attachments. Where data service for telemetry may not be sufficient, pressure transducers alone may be used and manually downloaded. Data will be used to evaluate surface water management changes in proximity of the wells, in the Rio Grande and along the Low Flow Conveyance Channel. All data provided must be highly accurate and with long term sustainable products, with long battery life and/or solar power. Data service must work through application programming interfaces (APIs) with common standard format for depth to water, water level elevation, water temperature, date, time and other relevant data. Vendors are encouraged to bid on installation support at these sites as well. Most wells are in remote locations with low or limited cellular data service. Cost estimates should include transducers, cables and devices (as needed for telemetry or monitoring), batteries/power source, annual data service plan, installation support, wellhead modifications (if needed), and other relevant features. Vendors should read provided materials on each well very carefully.

15.2 Data Collection Devices

- Required: Instrumentation for groundwater level measurements in 38 open-casing monitoring wells with depth to water ranging from 1 ft below ground surface to up to 20 ft below ground surface, with hourly measurements provided. Of the 38 Monitoring wells, 5 include nested piezometers with two wells in the same casing, (33 total locations). None of the wells have an active power source nearby.
- Required: Data service by application programming interface (API) in standard format.
- Required: Suggestions (based on inventory, photos, and vandalism concerns) about well head modifications which may be required for installation of vendor equipment
- Preferred: Installation support from vendor.
- Preferred: Data delivered to data system by radio or satellite telemetry, with easy upload to data system
- Preferred: Built in data calibration to periodic manual measurements conducted by field staff
- Preferred: After review of well notes for each site, particularly sites where it is noted that it may have high risk for vandalism, vendors can provide additional guidance, instructions, or cost estimates for adding security or containment of equipment to protect equipment/devices.
